to FLY?

The Facts and Figures

Traveling can be nerve-wracking

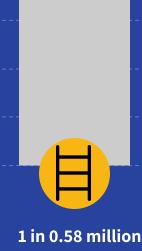

6.5 % of Americans suffer **AVIPHOBIA**, a fear of flying

...but that's over **20** million people

Airline accidents are uncommon

Odds of Death in a given year

chance from falling off of a ladder

chance from being struck by lightning

chance from a shark attack

chance from an airline accident

already exceedingly rare, only

There has never been

While airline accidents are

result in a fatality

percent of crashes

a safer time to fly

decreasing consistently by a factor of more than 2 every decade over the last fifty years

Worldwide, risk has been

experiencing no fatal crashes in the last 10 years and receiving a 7/7 safety rating from airlineratings.com

impeccable safety record,

Even as the number of flights increases year over year, the

due to ever improving safety features.

Not only is **flying** safer than it's ever been, it **continues to**

overall number of airline accidents continues to decrease

become safer every year.

Assignment 5.3, Project Task 4: Infographic

Scott Breitbach
DSC640: Data Presentation & Visualization
18-February-2022

After experiencing only limited traffic to the informational blog post, our company (Southwest Airlines) has decided that a shareable infographic may be a better way to proceed in order to get our message out to the general public that flying is a safe way to travel. In this infographic I tried to stick to basic, yet interesting facts that might help to comfort and ease the concerns of those who are hesitant to fly. I also used the Southwest Airlines color scheme throughout.

In the first section, I wanted to portray that fear of flying is not uncommon, with the goal to reassure worried individuals that they are not alone. There is also some subtle imagery with the 6.5% bar chart in that the bar is filled in to 6.5% of the total. In the second section, I tried to emphasize the sheer volume of air traffic and contrast that with the relatively low risk of dying in a plane crash, emphasizing other more common activities with higher risk. Finally in section 3 I discussed how the industry continues to get safer over time, with a bit of information specifically about Southwest Airlines excellent safety record.

One design issue I ran into was with the bar graph showing Odds of Death in a given year. Initially I used the values of the millions (0.58, 1.2, 3.7, 11), but this made the flight bar the tallest, which gave the impression that airlines were the least safe. I replaced these values with 1 / the value (1/0.58, 1/1.2, etc) to make the airline bar the smallest, visually indicating lowest risk. There is some ethical concern here due to manipulation of the data, but the goal is to show relative risk and without units on the graph I think this seems like a reasonable decision.

Another ethical consideration was around some data that I left out. I had rates of fatality risk for different regions of the world, with the US being among the safest nations, another group of "advancing" nations, and a third group of developing countries. While this would have made the US seem safer by contrast, I didn't want to denigrate the other parts of the world or make it seem as though they aren't safe (especially when the ultimate goal here is to portray flying as a safe means of travel).
